                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and the polynucleotides encoding them. The composition comprising TRICH CC or agonist of TRICH is useful for treating a disease or condition CRICH is useful for treating a disease or condition CC associated with decreased expression of functional TRICH or condition CC comprising Ab is useful for diagnosing a condition of disease associated with expression of TRICH in a subject, where the disorders include a CC transport disorder such as akinesia, cystic fibrosis, diabetes mellitus, Parkinson's disease, myasthenia gravis, cardiac disorders associated with transport e.g. angina, hypertension, myocarditis, neurological CC disorders associated with transport e.g. Alzheimer's disease, Wilson's disease, schizophrenia, cataracts, inferrility, hyperglycaemia, Grave's CC disease, schizophrenia, cataracts, inferrility, hyperglycaemia, Grave's CC disease, schizophrenia, cataracts, thuntington's disease, dementia, CC multiple sclerosis, bacterial and viral meningitis. TRICH DNA is useful CC for generating a transcript image of a tissue or cell type, which call type and for analysing the proteome of a tissue or cell type. TRICH DNA is used in gene therapy. The present sequence is human call type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC of an oligonucleotide comprising a sequence complementary to the Cc complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC clies of sequence, at least 15 nucleotides and the combination of CC the 5'-end sequence is selected from those defined in CC in gene therapy. The primer sets can be used in antisense therapy and CC in gene therapy full-length cDNAs. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the AAH1362B and CC AAH35893 represent human companies and AAH362B to AAH1363C colors of the proteines human amino acid sequences; AAB92446 to CC AAB95893 represent human amino acid sequences; AAB92446 to AAH1363C colors of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

sequence and an oilgonucleotide comprising a sequence, where the ollgonucleotide which comprises a 3'-end sequence, where the ollgonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH18628 and AAH13633 to AAH18742 represent human cDNA sequences; AB92446 to AAH13639 represent human amino acid sequences; and AAH13629 to AAH13632 represent oilgonucleotides, all of which are used in the exemplification of the property in the primers and property of the primers and AAH13639 to AAH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

```
This sequence represents a nucleic acid molecule designated Gene 96 from the human cDNA clone HADBK61 (deposited as clone ATCC 97897 and ATCC 209043) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human climmunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only.

CC The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV5951) for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                          Feng P, F
Kyaw H, L

                                                                                                                                                                                                                                                                                                                                                                                        //ab_host="blub" (Life Technologies)"
//ab_host="blub" (Life Technologies)"
//ab_host="blub" (Life Technologies) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; The UI-R-C2 library is a subtracted library derived from the UI-R-C3 library; which is a subtracted library derived from the UI-R-C3 library. The UI-R-C3 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present identification of the library of origin of a clone within constructed as follows: PCR amplified CDNA inserts from UI-R-C1 clones from which 3; ESTS had been derived was UI-R-C1 clones from which 3; ESTS had been derived was UI-R-C1 clones from which 3; ESTS had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DHIOB bacteria (Life Technologies) to generate the described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996)"
